

Supplementary Fig. S2 – Mycelial dry weight of *Tuber japonicum* on modified Melin–Norkrans liquid medium at different temperatures.

Each value represents a mean with standard deviation ( $n = 5$ ). Different letters indicate significant differences among temperatures in each strain (Tukey–Kramer test,  $p < 0.05$ ). The final pH value of the medium was ca. 5.5 after 50 d of incubation. Significant interaction was found between temperature and fungal strain (two-way ANOVA: temperature,  $F = 143.7$ ,  $p < 0.001$ ; strain,  $F = 10.80$ ,  $p < 0.001$ ; interaction,  $F = 13.08$ ,  $p < 0.001$ ).
